

***UHECRs: come correre il
megaparsec in 1000 secondi***

**Victor Hess before his 1912 balloon flight
in Austria, during which he discovered
cosmic rays**

Phys Rev 1933

Pontecorvo, in a famous toast: "I drink not to Beppo, but to us all: may we collaborate with him, it is a practically sure way of winning a Nobel Prize".

***Carl Anderson (1905-1991) Nobel prize in
1936***

Beppo Occhialini (1907-1993)

UHE Cosmic rays

$$**E=mc^2**$$

$$**E=\gamma m_0 c^2, \text{ if } m_0 \text{ is a proton, then}**$$

$$**\gamma=10^{11}**$$

22 times 9

$$**\beta=0.99999999999999999999999999999995**$$

$$**10^{20} \text{ eV} = 10^8 \text{ TeV} = 10^{11} m_p c^2 = \text{tennis ball at}**$$

$$**100 \text{ km/s}**$$

1 Megaparsec in 1000 seconds

Time for us, watching the moving particle, is $t = 3 \times 10^{24} \beta c = 10^{14}$ sec

Time for the particle, watching us approaching, is $t' \sim t/\gamma = 10^3$ sec

Human accelerators

LHC \Rightarrow ~ 7 TeV protons $\Rightarrow \gamma = 7000$

Where do they come from?

- **Low energy: within our Galaxies. B-field mixes up all directions.**
- **High energy: B-field not enough to trap them, difficult to accelerate. Extra-galactic, but what sources? A mystery.**

Larmor radius:
$$\frac{\gamma m_p c^2}{eB} = \frac{10^{12} \gamma}{B_{gal}} \text{ cm}$$

GZK effect

Greisen 1996; Zatsepin &

Kuz'min 1966

Important above 10^{19} ev. For 10^{20} ev, only those UHECRs born **within 100 Mpc** can reach us

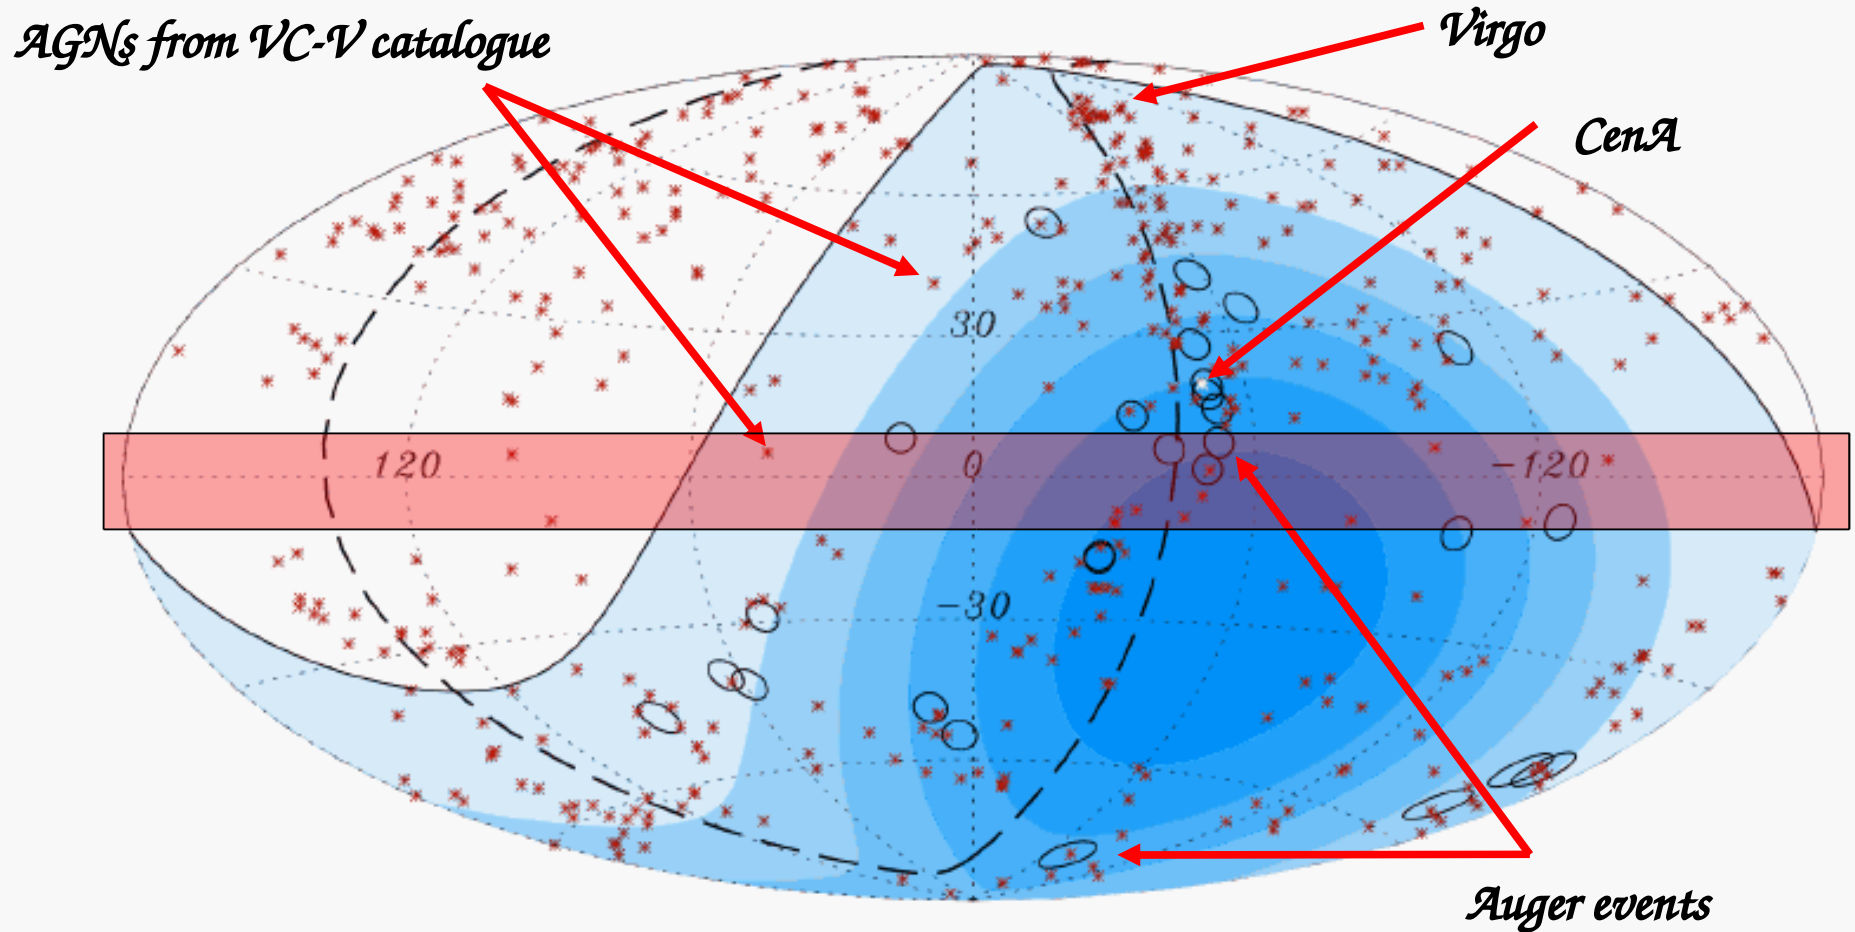

27 Auger Events >57 EeV

1 EeV = 10^{18} eV

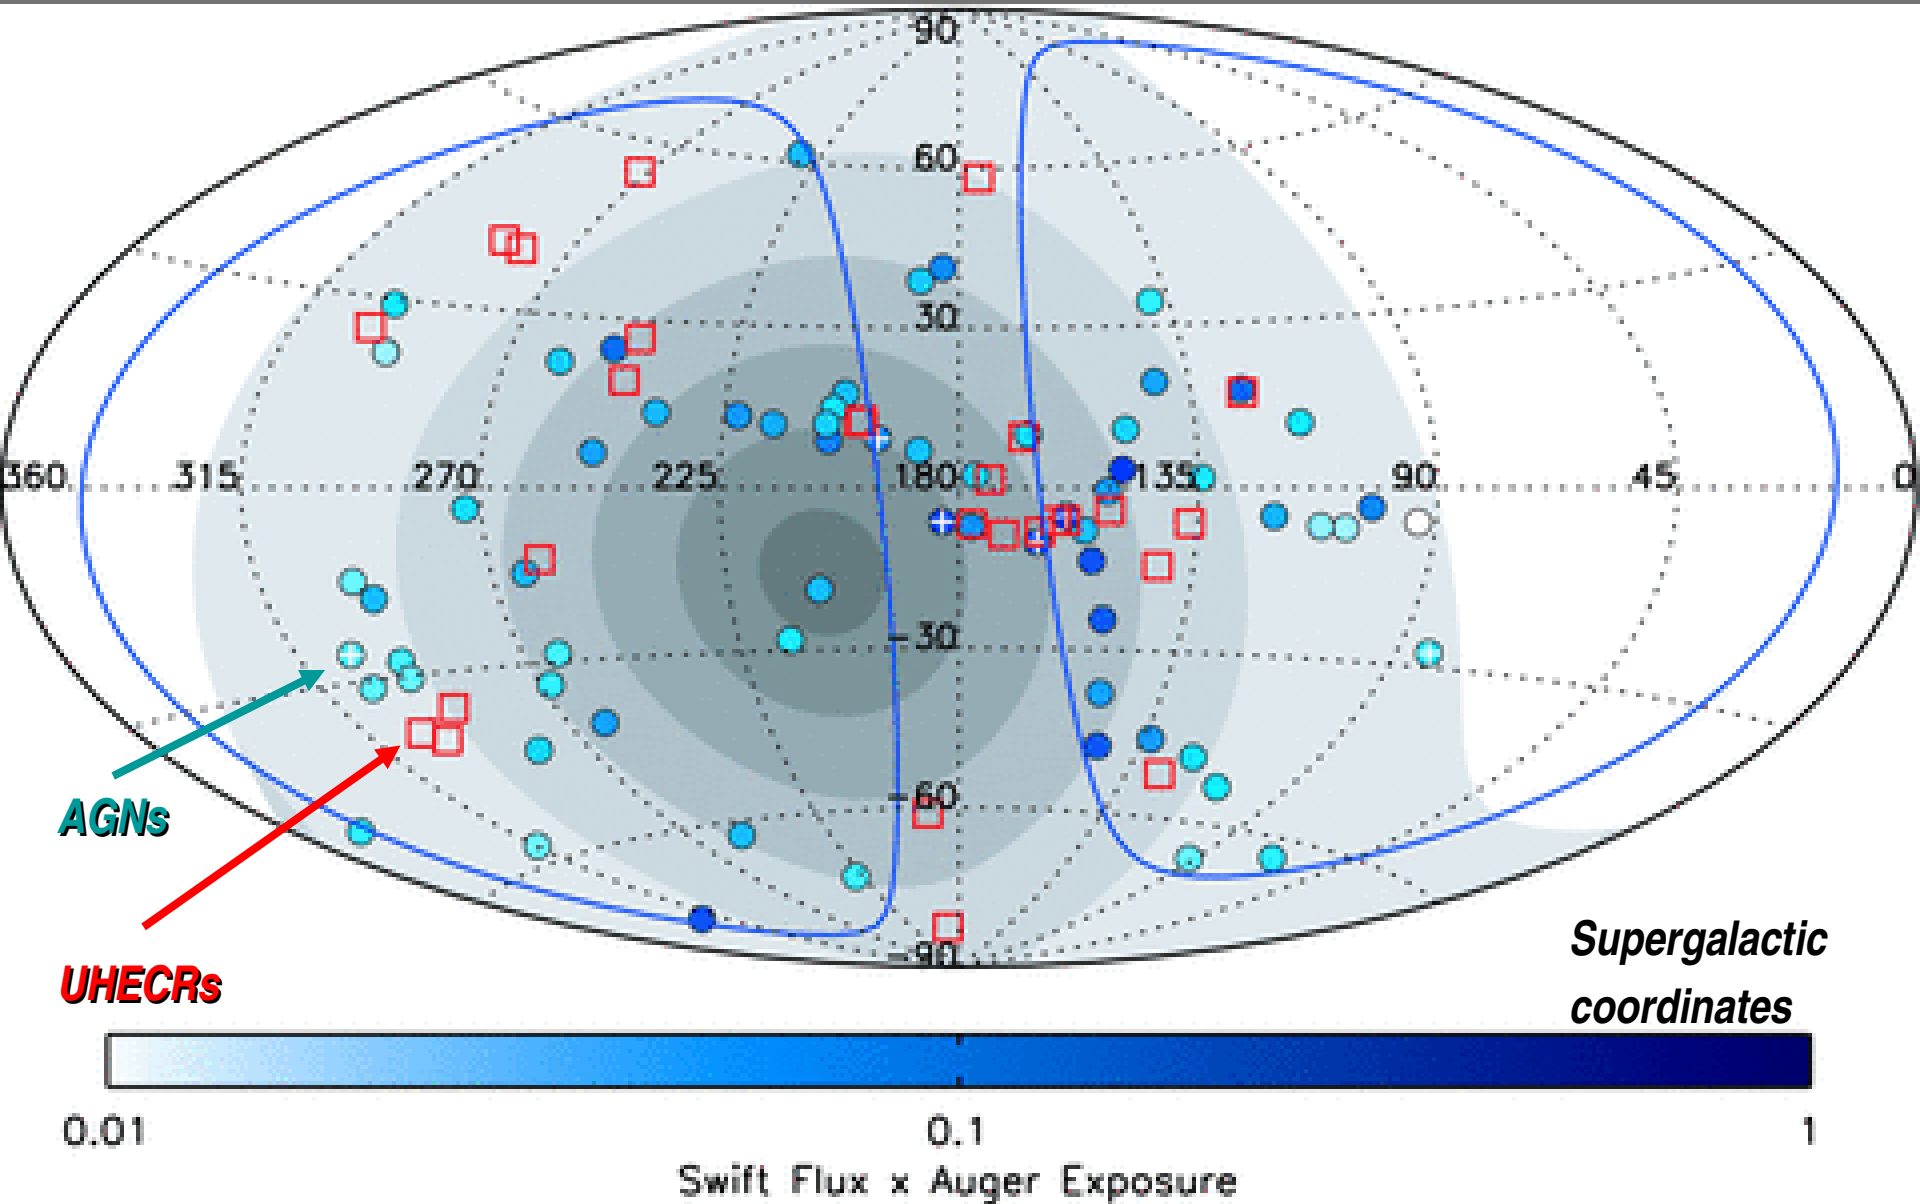

The Auger collaboration, 2007, Science

If the Galactic plane is excluded, 19 out of 21 events do correlate

The Auger collaboration, 2007, Science

George, Fabian, Baumgartner, Mushotzky, Teueller 2008: Swift/BAT AGNs

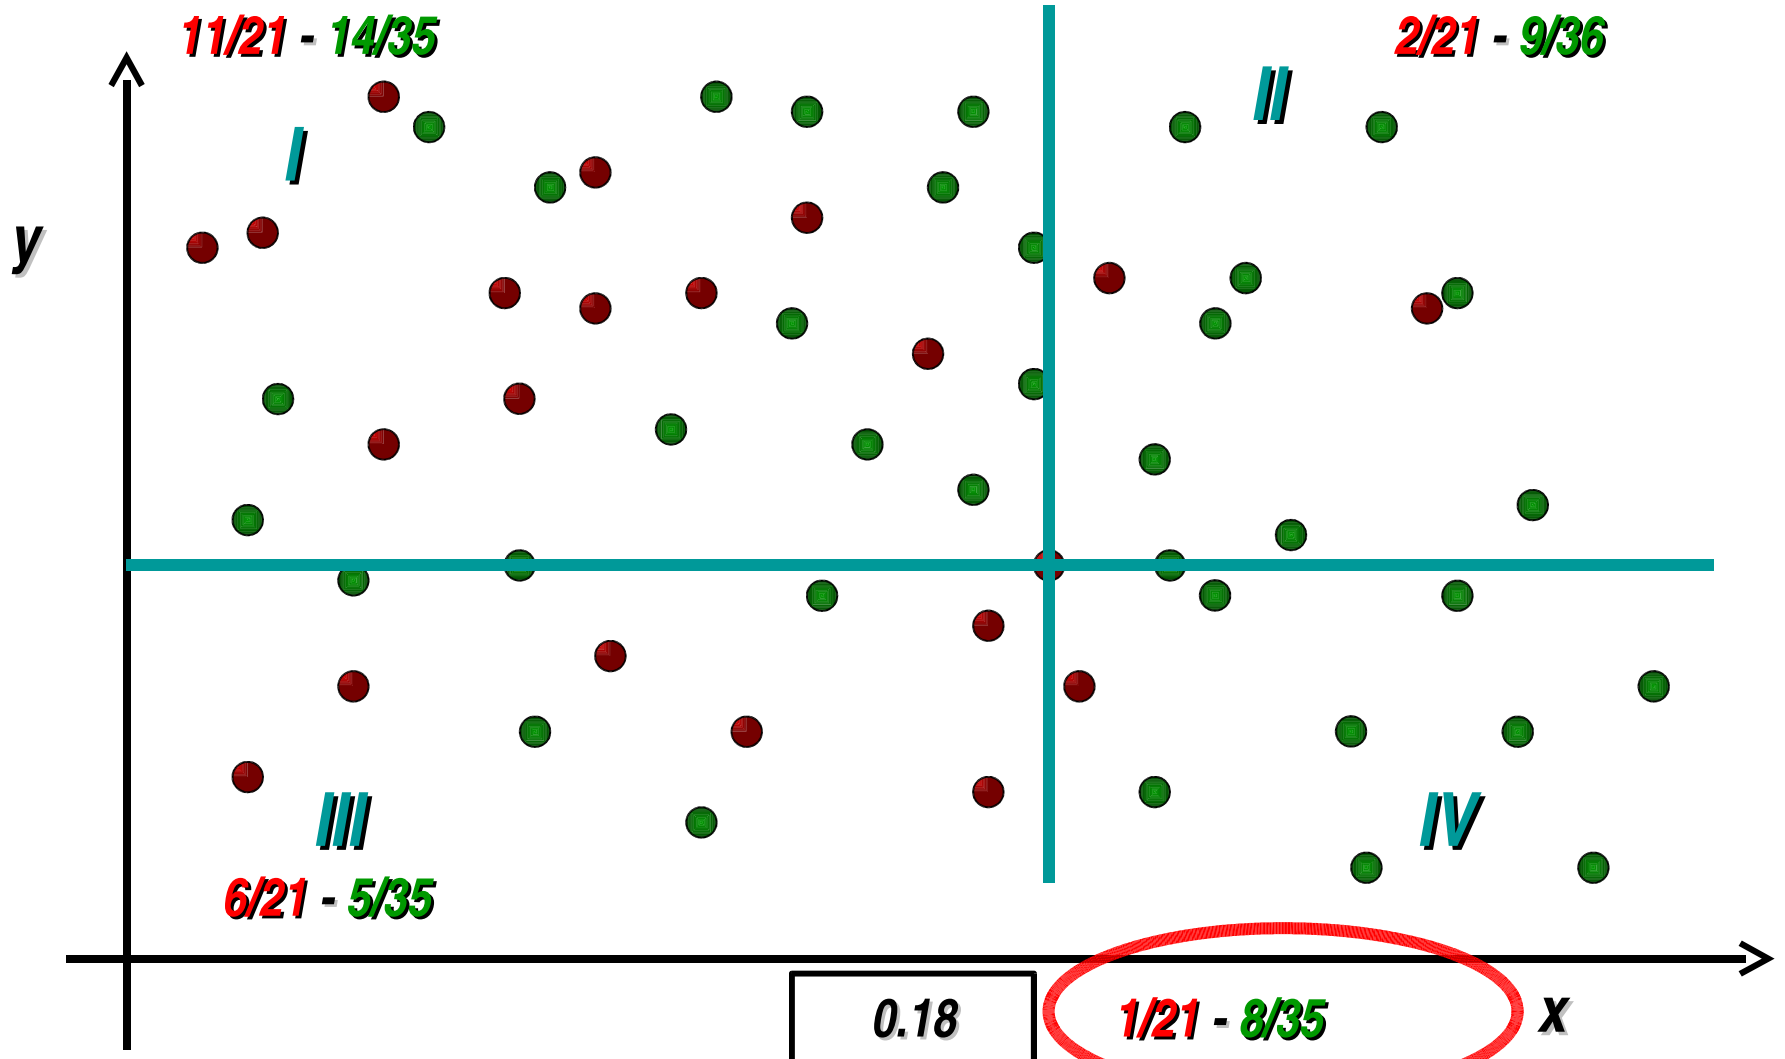

2D Kolmogorov Smirnov

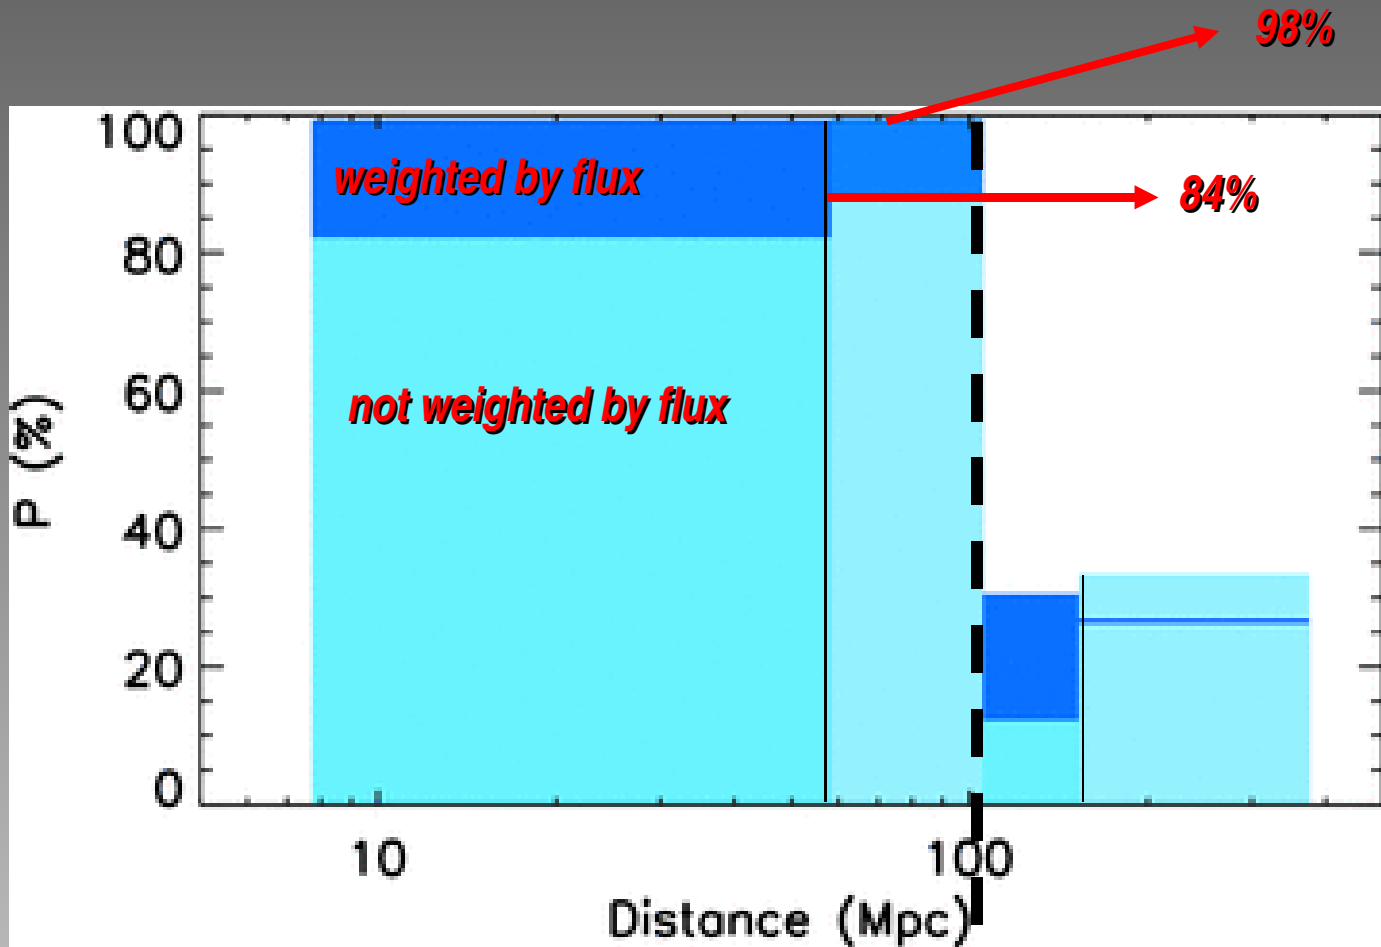

2D Kolmogorov Smirnov

2D Kolmogorov Smirnov

138 AGNs; 19 UHECRs with $|b| < 15^\circ$, $\delta < 25^\circ$

57 AGNs within 100 Mpc

GZK effect

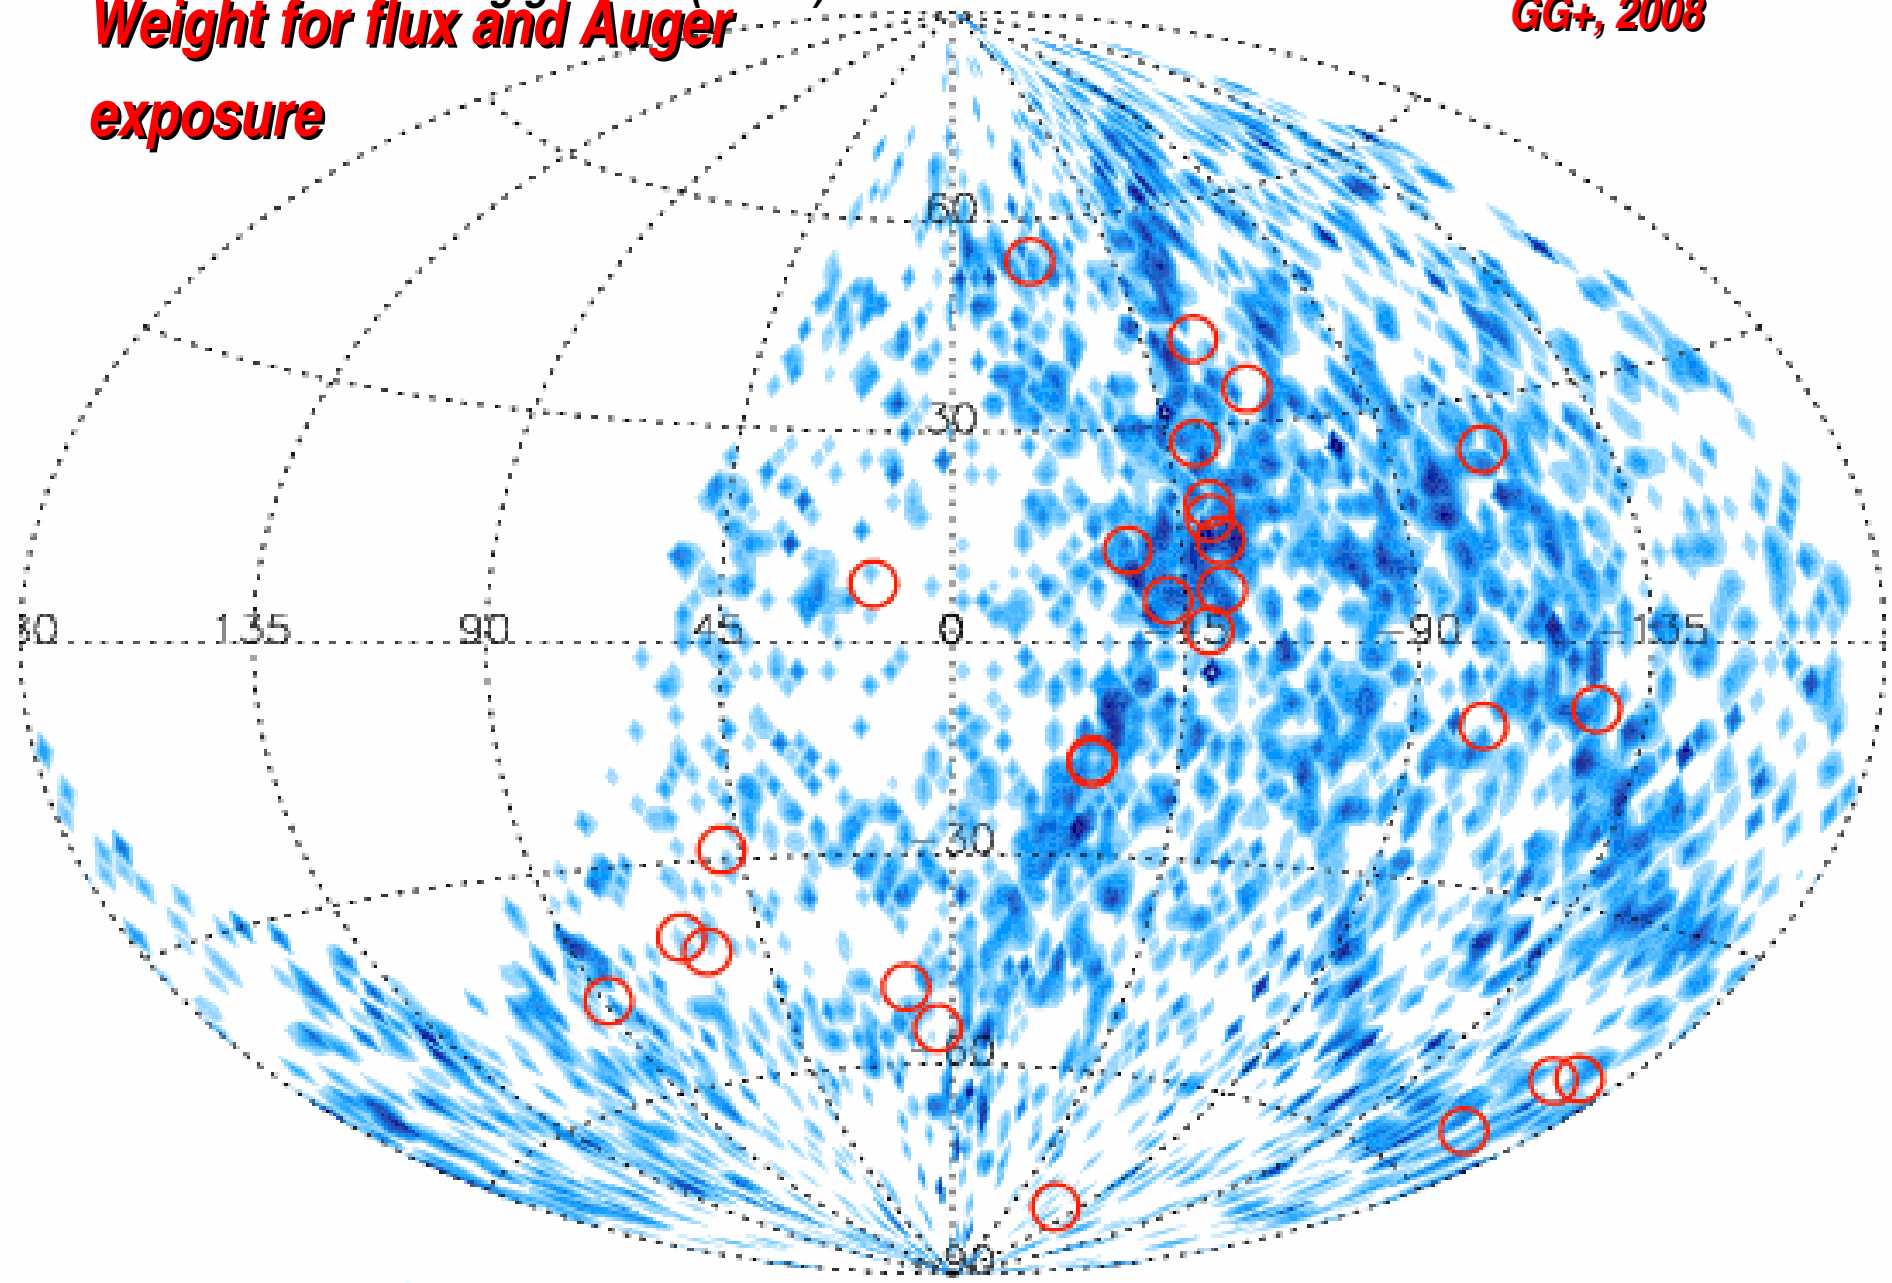

Radio quiet AGN???

HIPASS: ~5000 HI emitting galaxies (21 cm)

Weight for flux and Auger

exposure

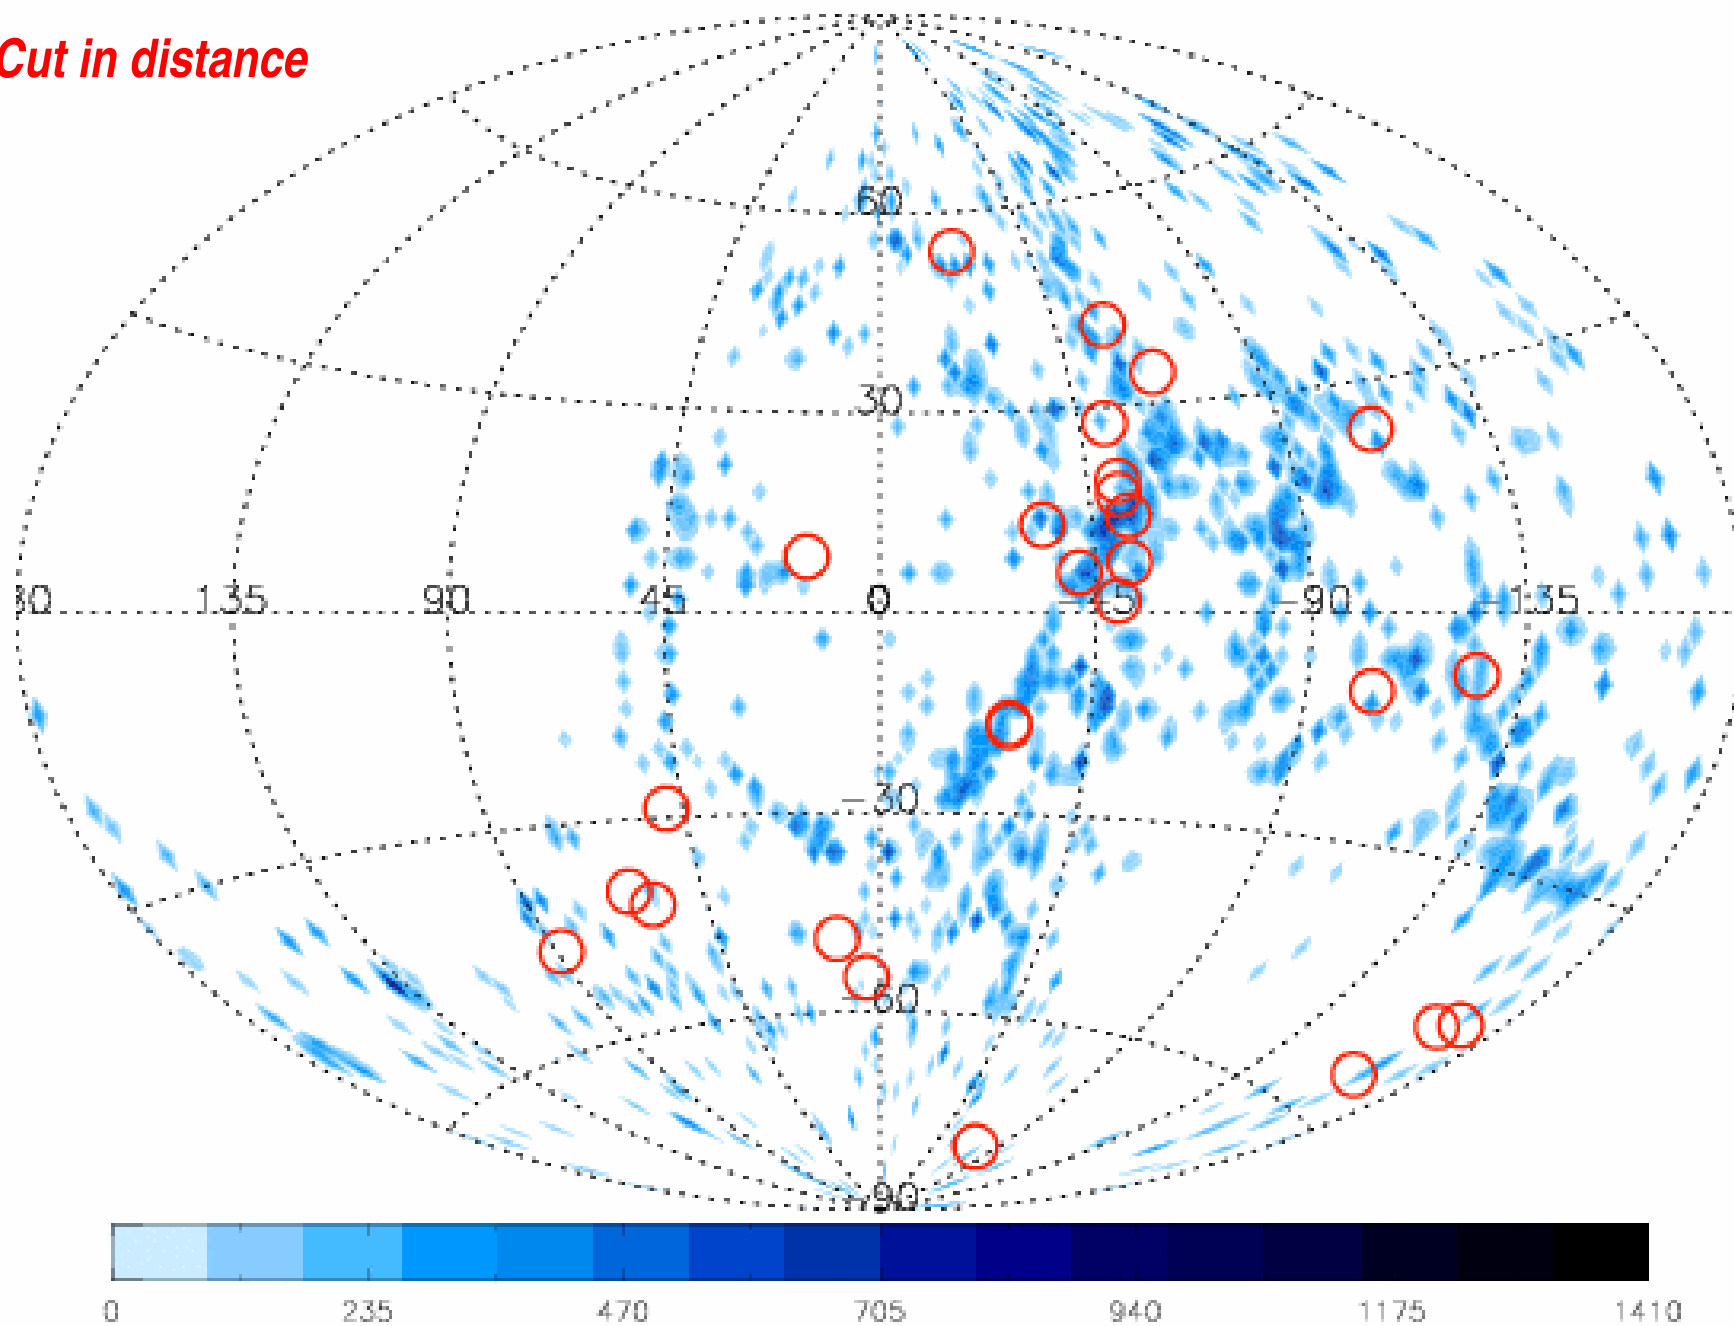

GG+, 2008

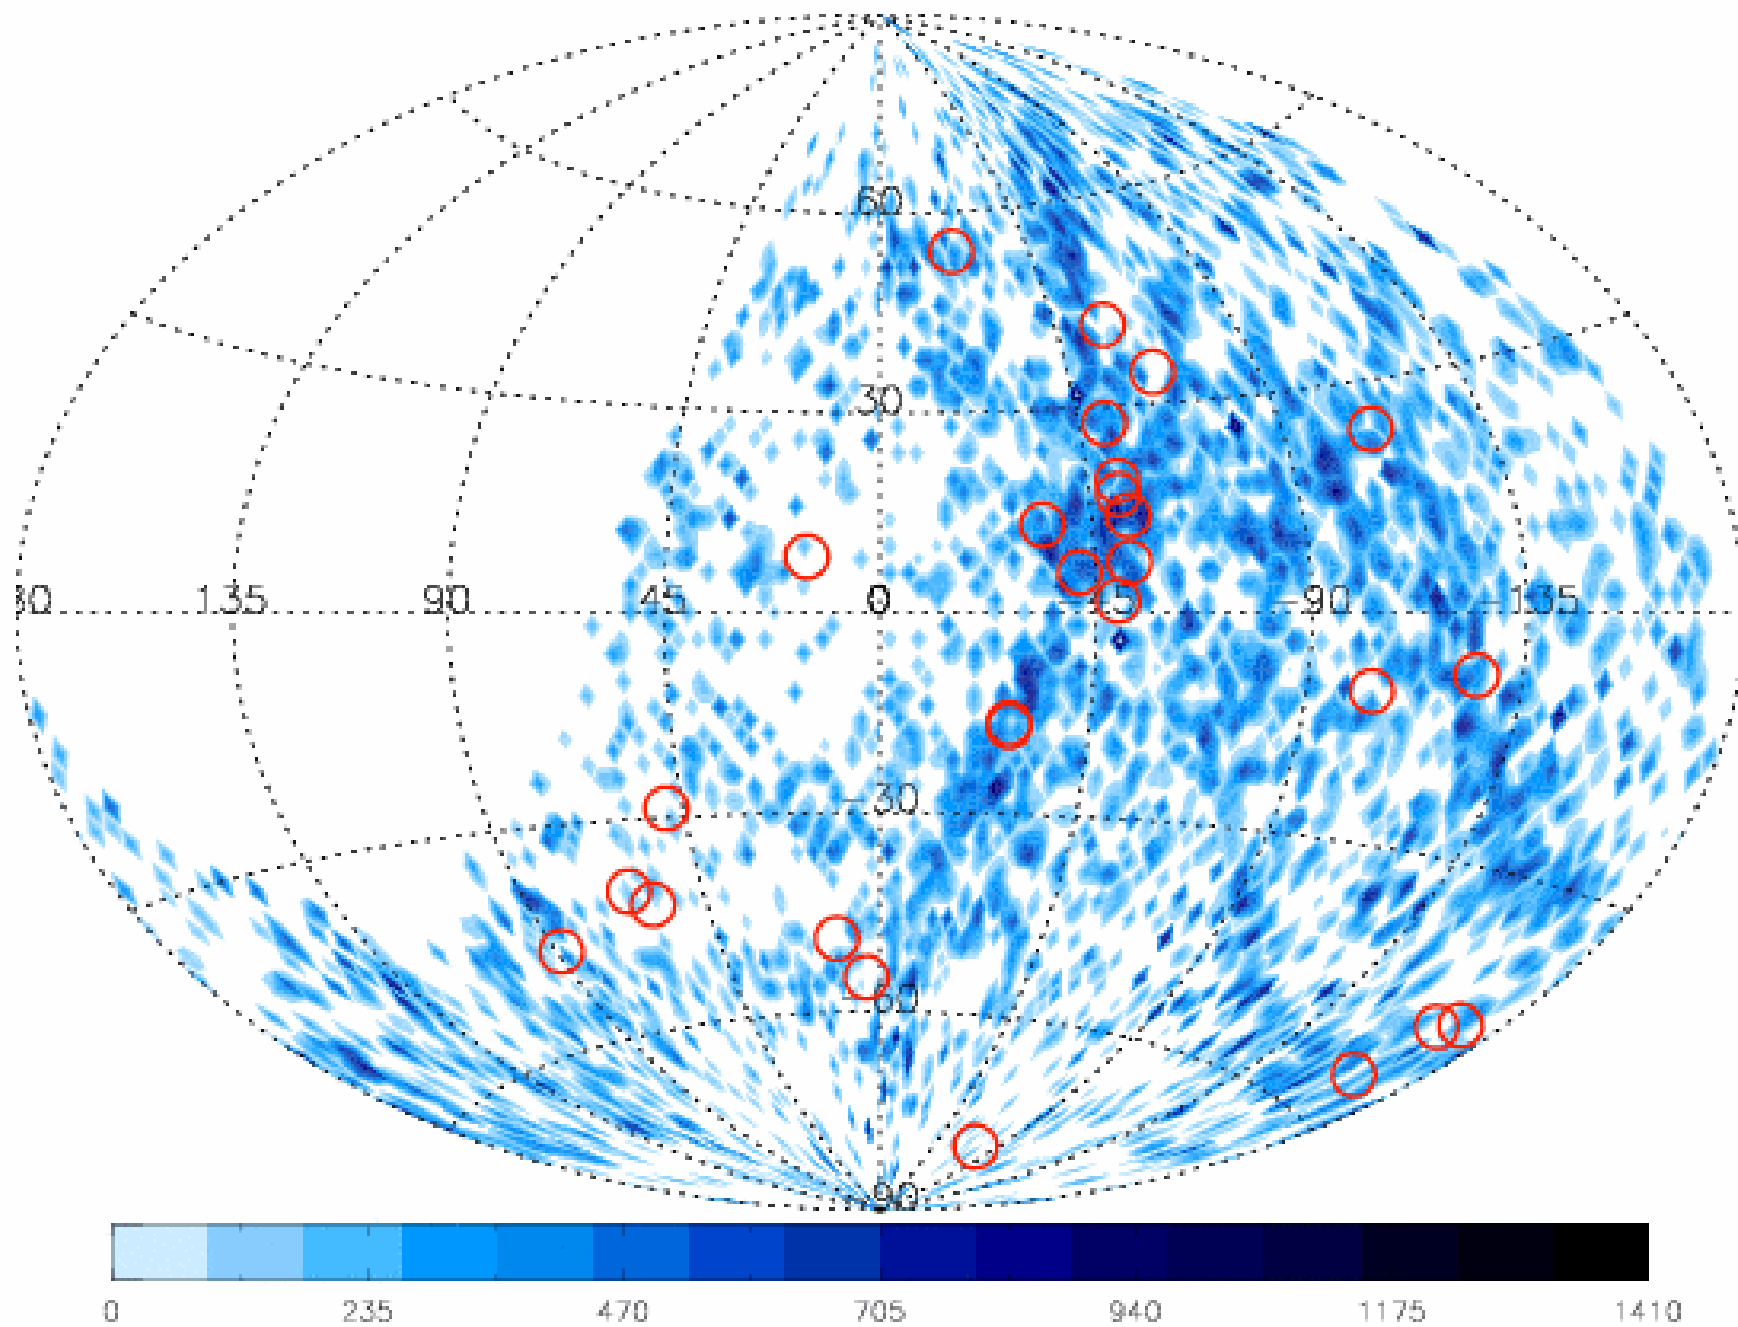

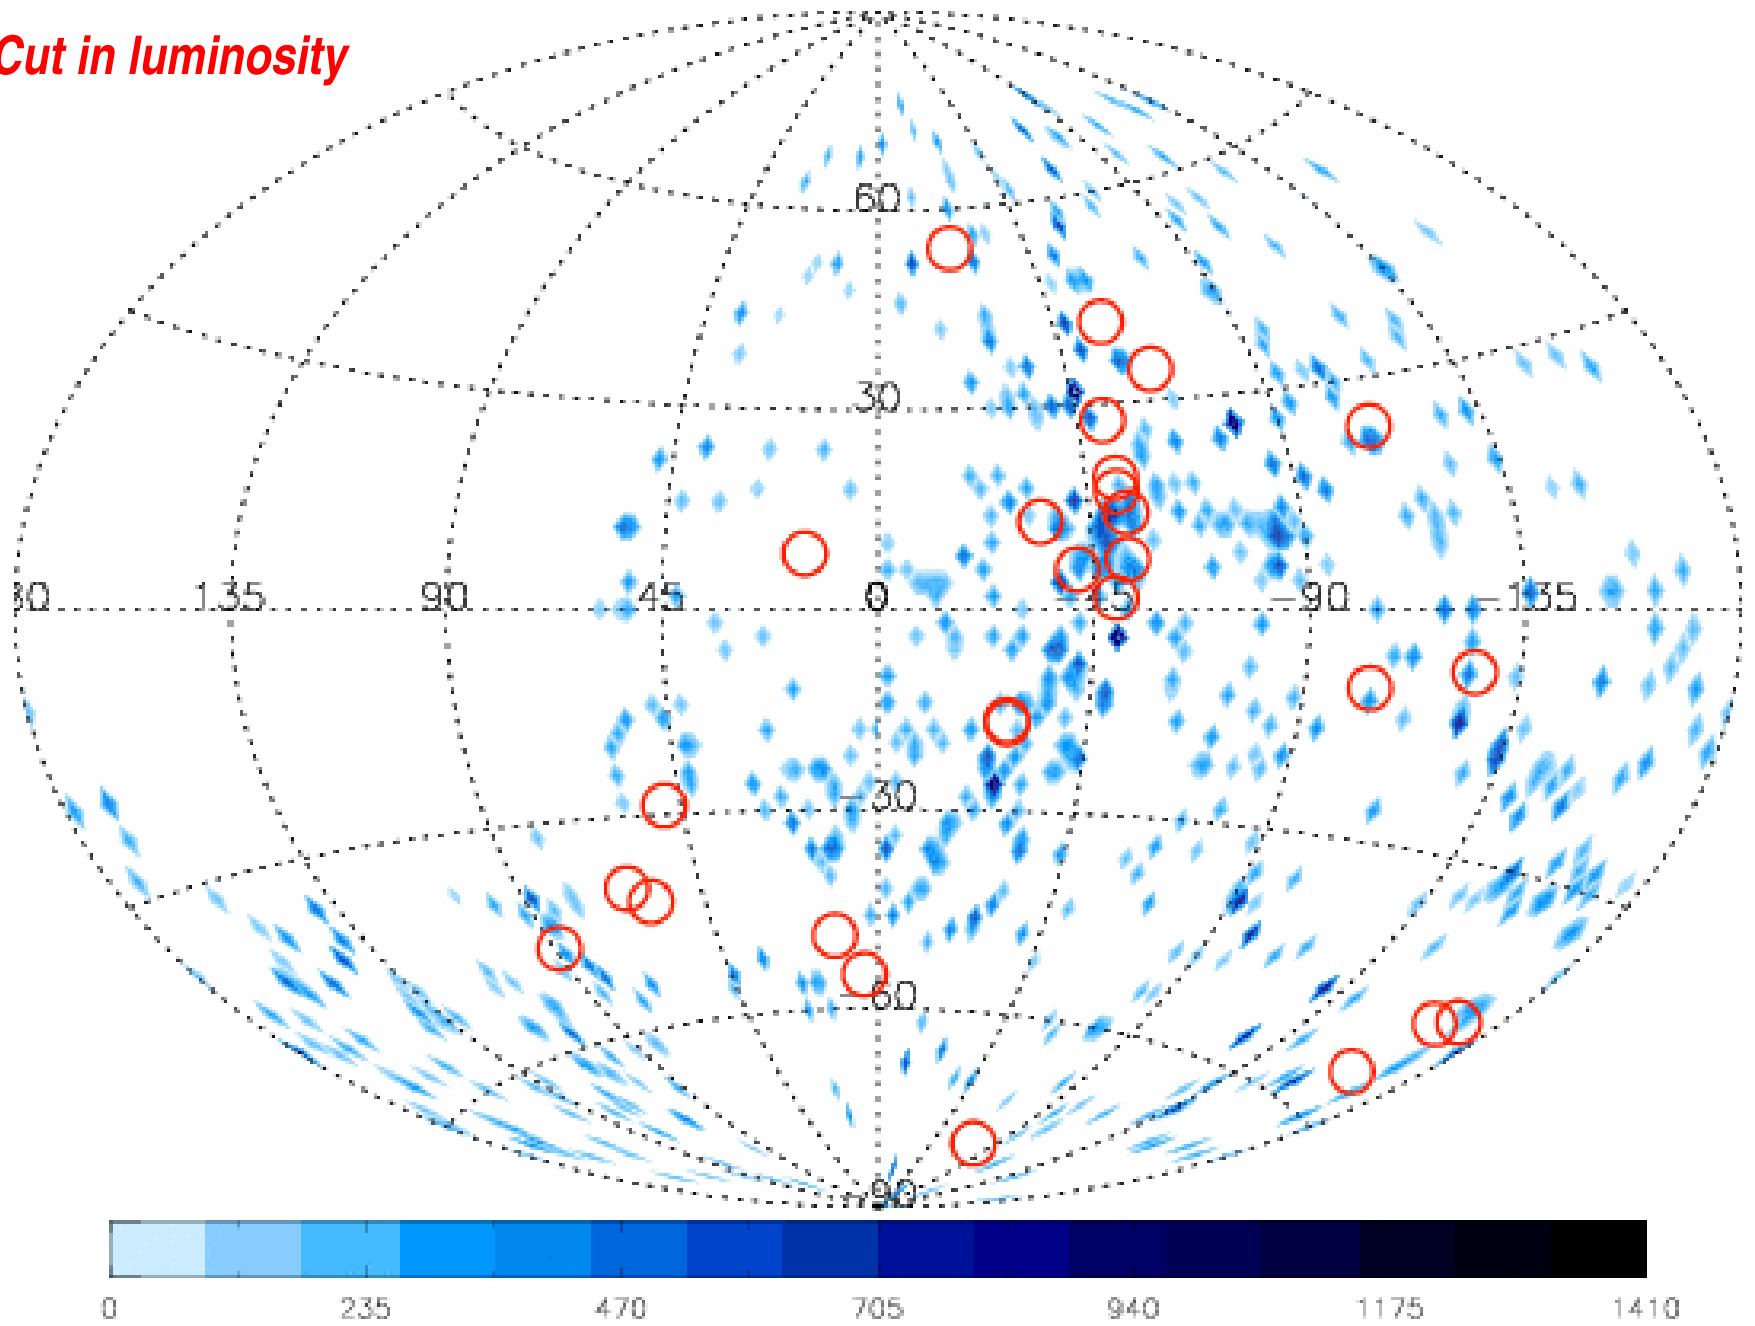

Cut in distance

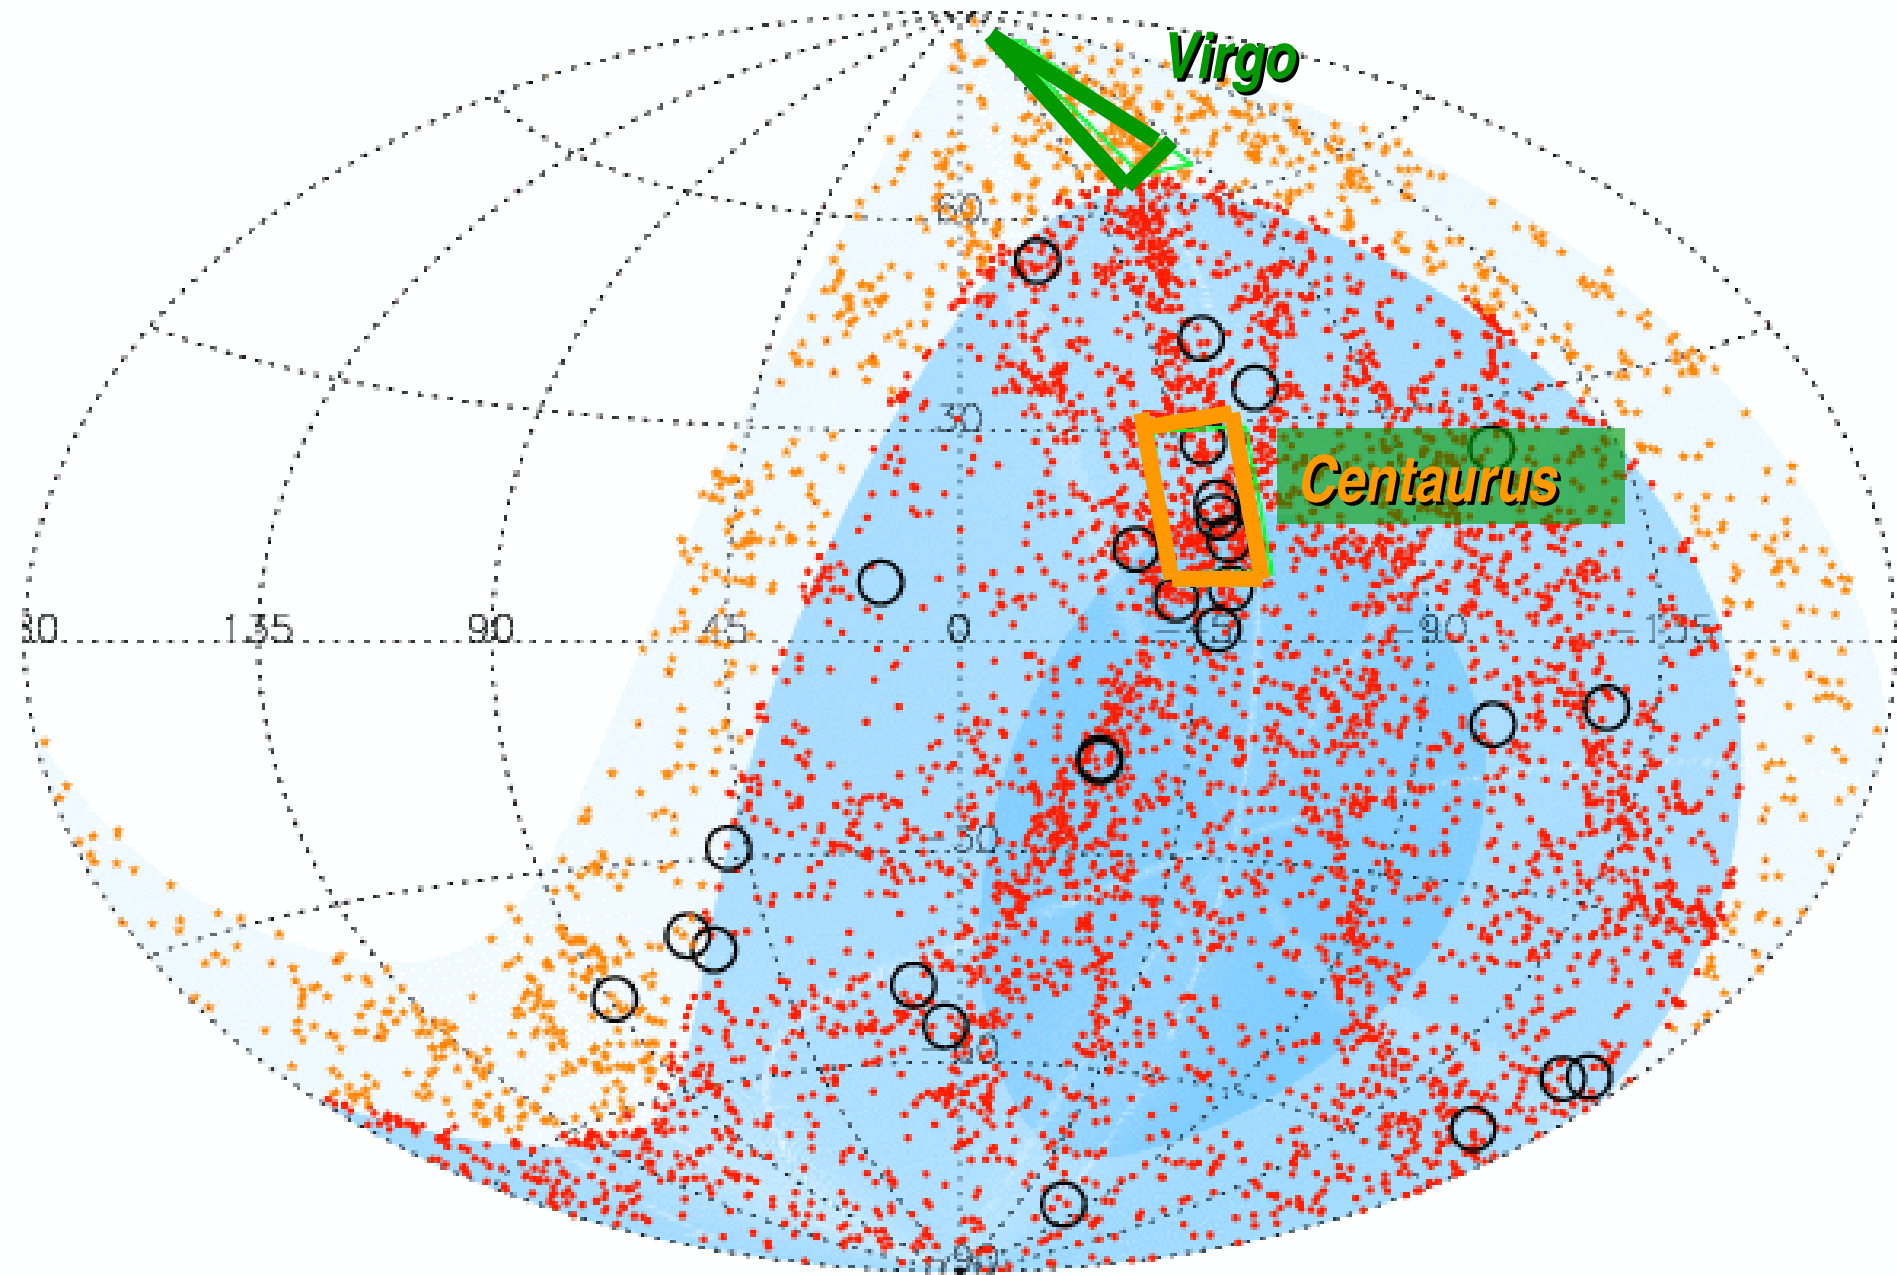

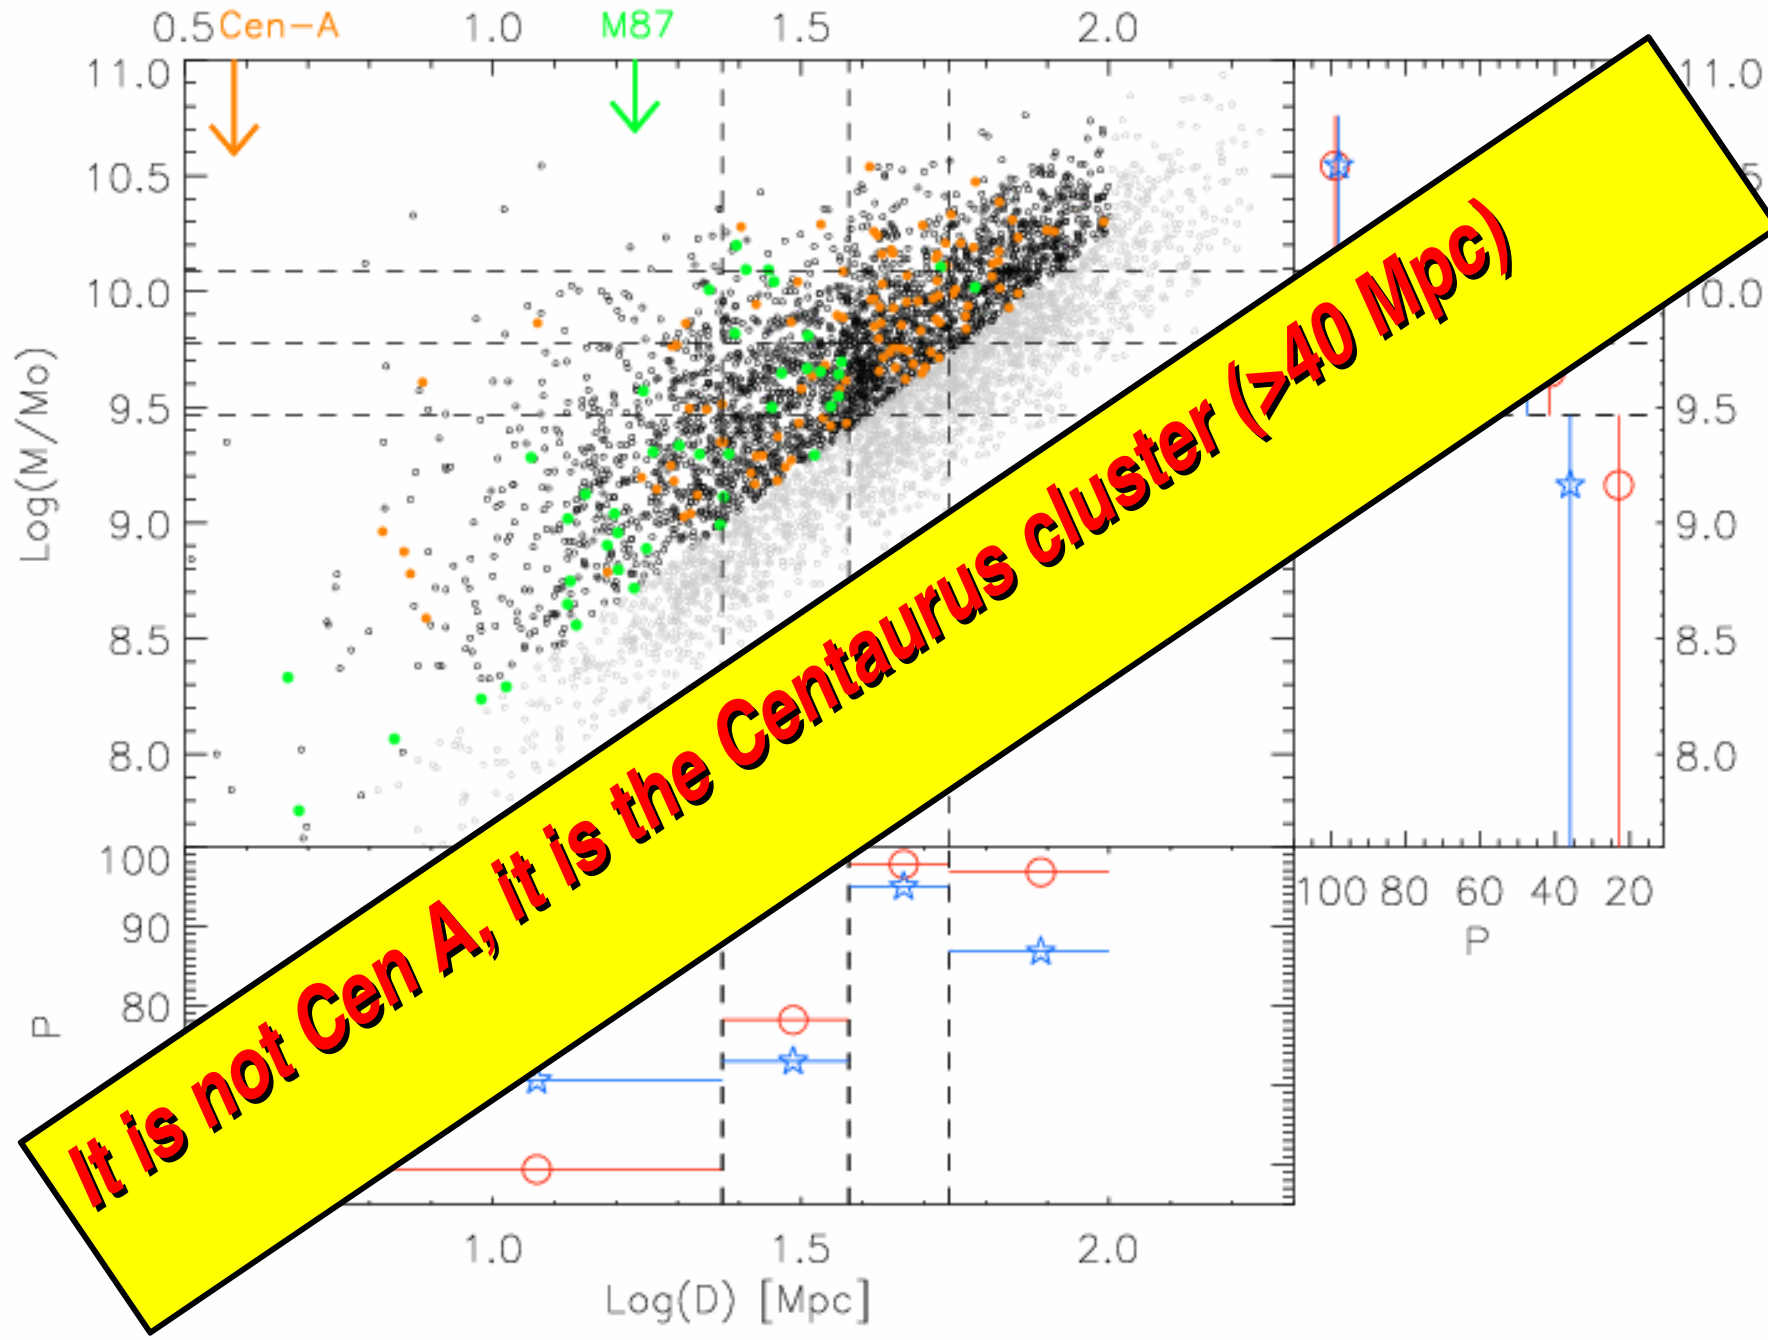

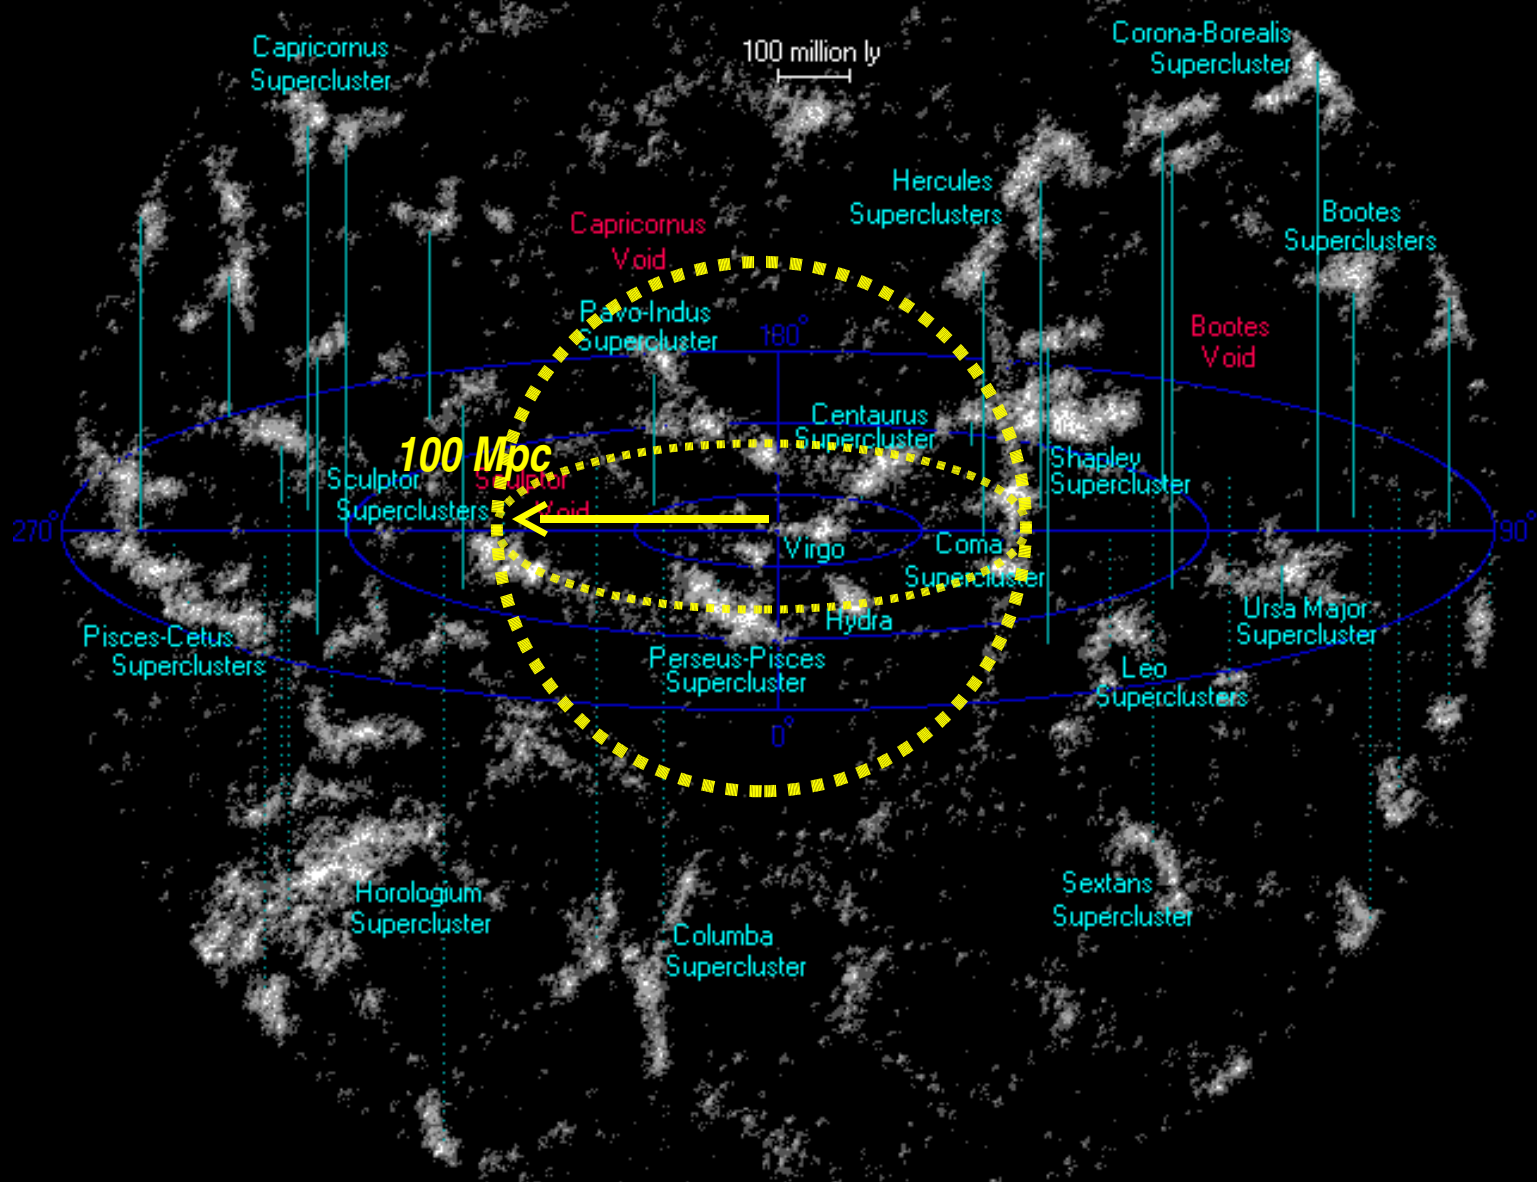

Cut in luminosity

Progenitors

$F_{\text{Auger}} \sim 10^{-11} \text{ erg cm}^2 \text{ s}^{-1}$ Flux for $E > 57 \text{ EeV}$

● Easy for AGNs (but they are radio-quiet... no γ)

Progenitors

$F_{\text{Auger}} \sim 10^{-11} \text{ erg cm}^2 \text{ s}^{-1}$ Flux for $E > 57 \text{ EeV}$

- Easy for AGNs (but they are radio-quiet... no γ)
- Short 'BATSE' GRBs: 150 yr^{-1} ; $\langle \text{Fluence} \rangle \sim 10^7$; 1/10 nearby \rightarrow
flux not enough (if $F_{\text{em}} = F_{\text{CR}}$)

Progenitors

$F_{\text{Auger}} \sim 10^{-11} \text{ erg cm}^2 \text{ s}^{-1}$ Flux for $E > 57 \text{ EeV}$

- Easy for AGNs (but they are radio-quiet... no γ)
- Short 'BATSE' GRBs: 150 yr^{-1} ; $\langle \text{Fluence} \rangle \sim 10^7$; 1/10 nearby \rightarrow
flux not enough (if $F_{\text{em}} = F_{\text{CR}}$)
- Long 'BATSE' GRBs: 450 yr^{-1} ; $\langle \text{Fluence} \rangle \sim 10^6$;
very few nearby \rightarrow (too distant)

Progenitors

$F_{\text{Auger}} \sim 10^{-11} \text{ erg cm}^2 \text{ s}^{-1}$ Flux for $E > 57 \text{ EeV}$

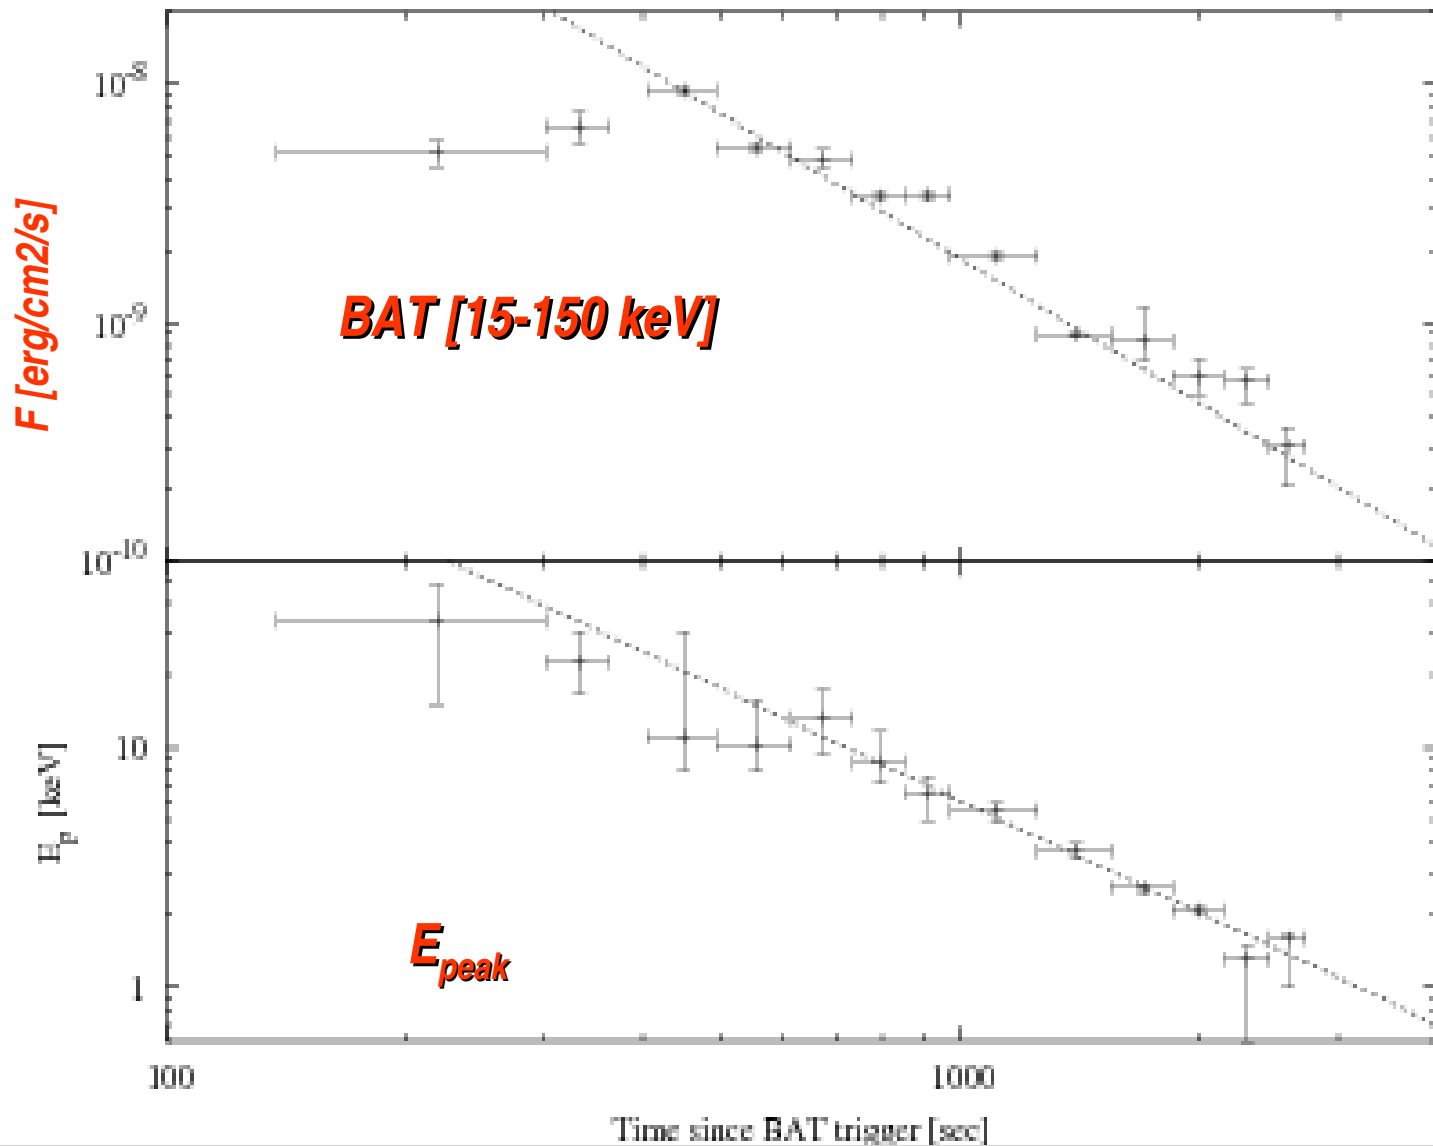

- Easy for AGNs (but they are radio-quiet... no γ)
- Short 'BATSE' GRBs: 150 yr^{-1} ; $\langle \text{Fluence} \rangle \sim 10^7$; 1/10 nearby \rightarrow
flux not enough (if $F_{\text{em}} = F_{\text{CR}}$)
- Long 'BATSE' GRBs: 450 yr^{-1} ; $\langle \text{Fluence} \rangle \sim 10^6$;
very few nearby \rightarrow (too distant)
- Giant Flares of Magnetars (flux not enough)

Progenitors

$F_{\text{Auger}} \sim 10^{-11} \text{ erg cm}^2 \text{ s}^{-1}$ Flux for $E > 57 \text{ EeV}$

- Easy for AGNs (but they are radio-quiet... no γ)
- Short 'BATSE' GRBs: 150 yr^{-1} ; $\langle \text{Fluence} \rangle \sim 10^7$; 1/10 nearby \rightarrow
flux not enough (if $F_{\text{em}} = F_{\text{CR}}$)
- Long 'BATSE' GRBs: 450 yr^{-1} ; $\langle \text{Fluence} \rangle \sim 10^6$;
very few nearby \rightarrow (too distant)
- Giant Flares of Magnetars (flux not enough)
 - Newly born, fastly spinning Magnetars (!!!), but went unobserved by BATSE)

GRB 060218 ???

GRB 060218 ???

GRB 060218 ???

- **Very long, soft, underluminous, nearby (145 Mpc)**
- **It could not have triggered BATSE**
- **Proposed to be a newborn magnetar**
- **(Soderberg+ 2007; Toma+ 2007)**
- **Right rate**

Hillas-plot

(candidate sites for $E=100$ EeV and $E=1$ ZeV)

$$E_{\text{max}} \sim ZBL \quad (\text{Fermi})$$

$$E_{\text{max}} \sim ZBL \Gamma \quad (\text{Ultra-relativistic shocks-GRB})$$

Conclusions

- ***UHECRs correlate with spirals***
- ✂ ***⇒ newly born magnetars?***
- ***$E_{CR} \sim 10^{50}$ erg. Rate: 1 every 10^4 years per galaxy***
- ***New class of GRBs (2 per yr all sky): similar to GRB 060218: soft, very long, underluminous+SN***

Large Scale Structure in the Local Universe

Legend: image shows 2MASS galaxies color coded by redshift (Jarrett 2004); familiar galaxy clusters/superclusters are labeled (numbers in parenthesis represent redshift).
