

Cosmological results from the galaxy power spectrum of the VIPERS galaxy distribution

Stefano Rota
Astrosiesta 17/11/2016

- Estimate galaxy clustering on large scales
- Compare with theory
- Extract cosmological quantities

Clustering in Configuration space

$$\xi(\mathbf{x}_1, \mathbf{x}_2) \equiv \langle \delta(\mathbf{x}_1) \delta(\mathbf{x}_2) \rangle$$

Clustering in Fourier space

$$P(\mathbf{k}_1, \mathbf{k}_2) \equiv \langle \delta(\mathbf{k}_1) \delta^*(\mathbf{k}_2) \rangle$$

VIPERS

- VIMOS @ ESO VLT

- 2 fields: W1 and W4 of CFHTLS

- angular coverage 24 deg²

- redshift range: $0.4 < z < 1.2$

- $\sim 100,000$ galaxies

VIPERS $P(k)$

Observation VS Theory

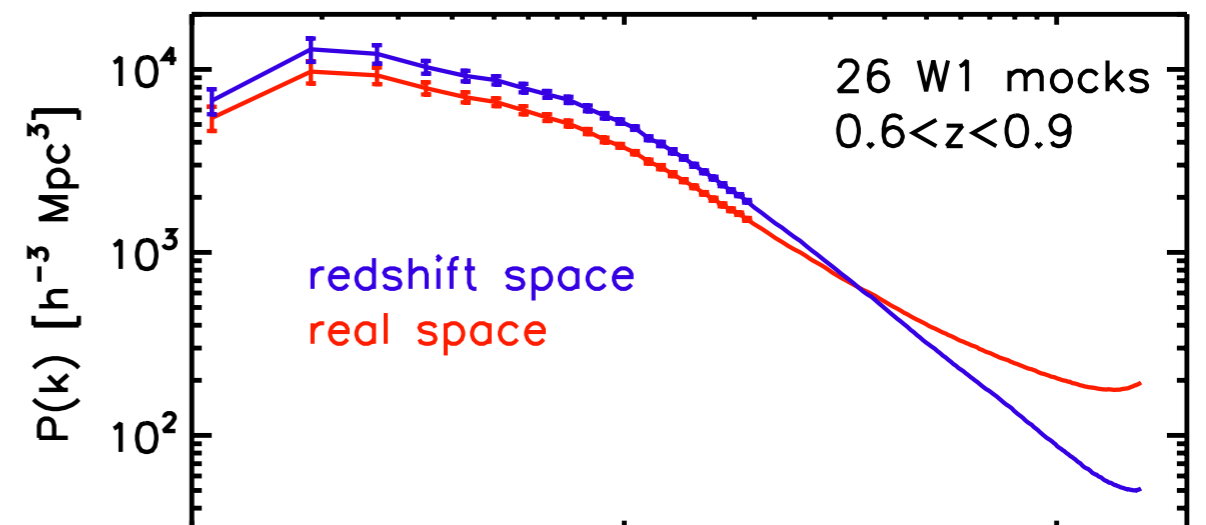

Observation VS Theory

- 1) bias
- 2) redshift space distortions
- 3) window function

window function

redshift space distortions

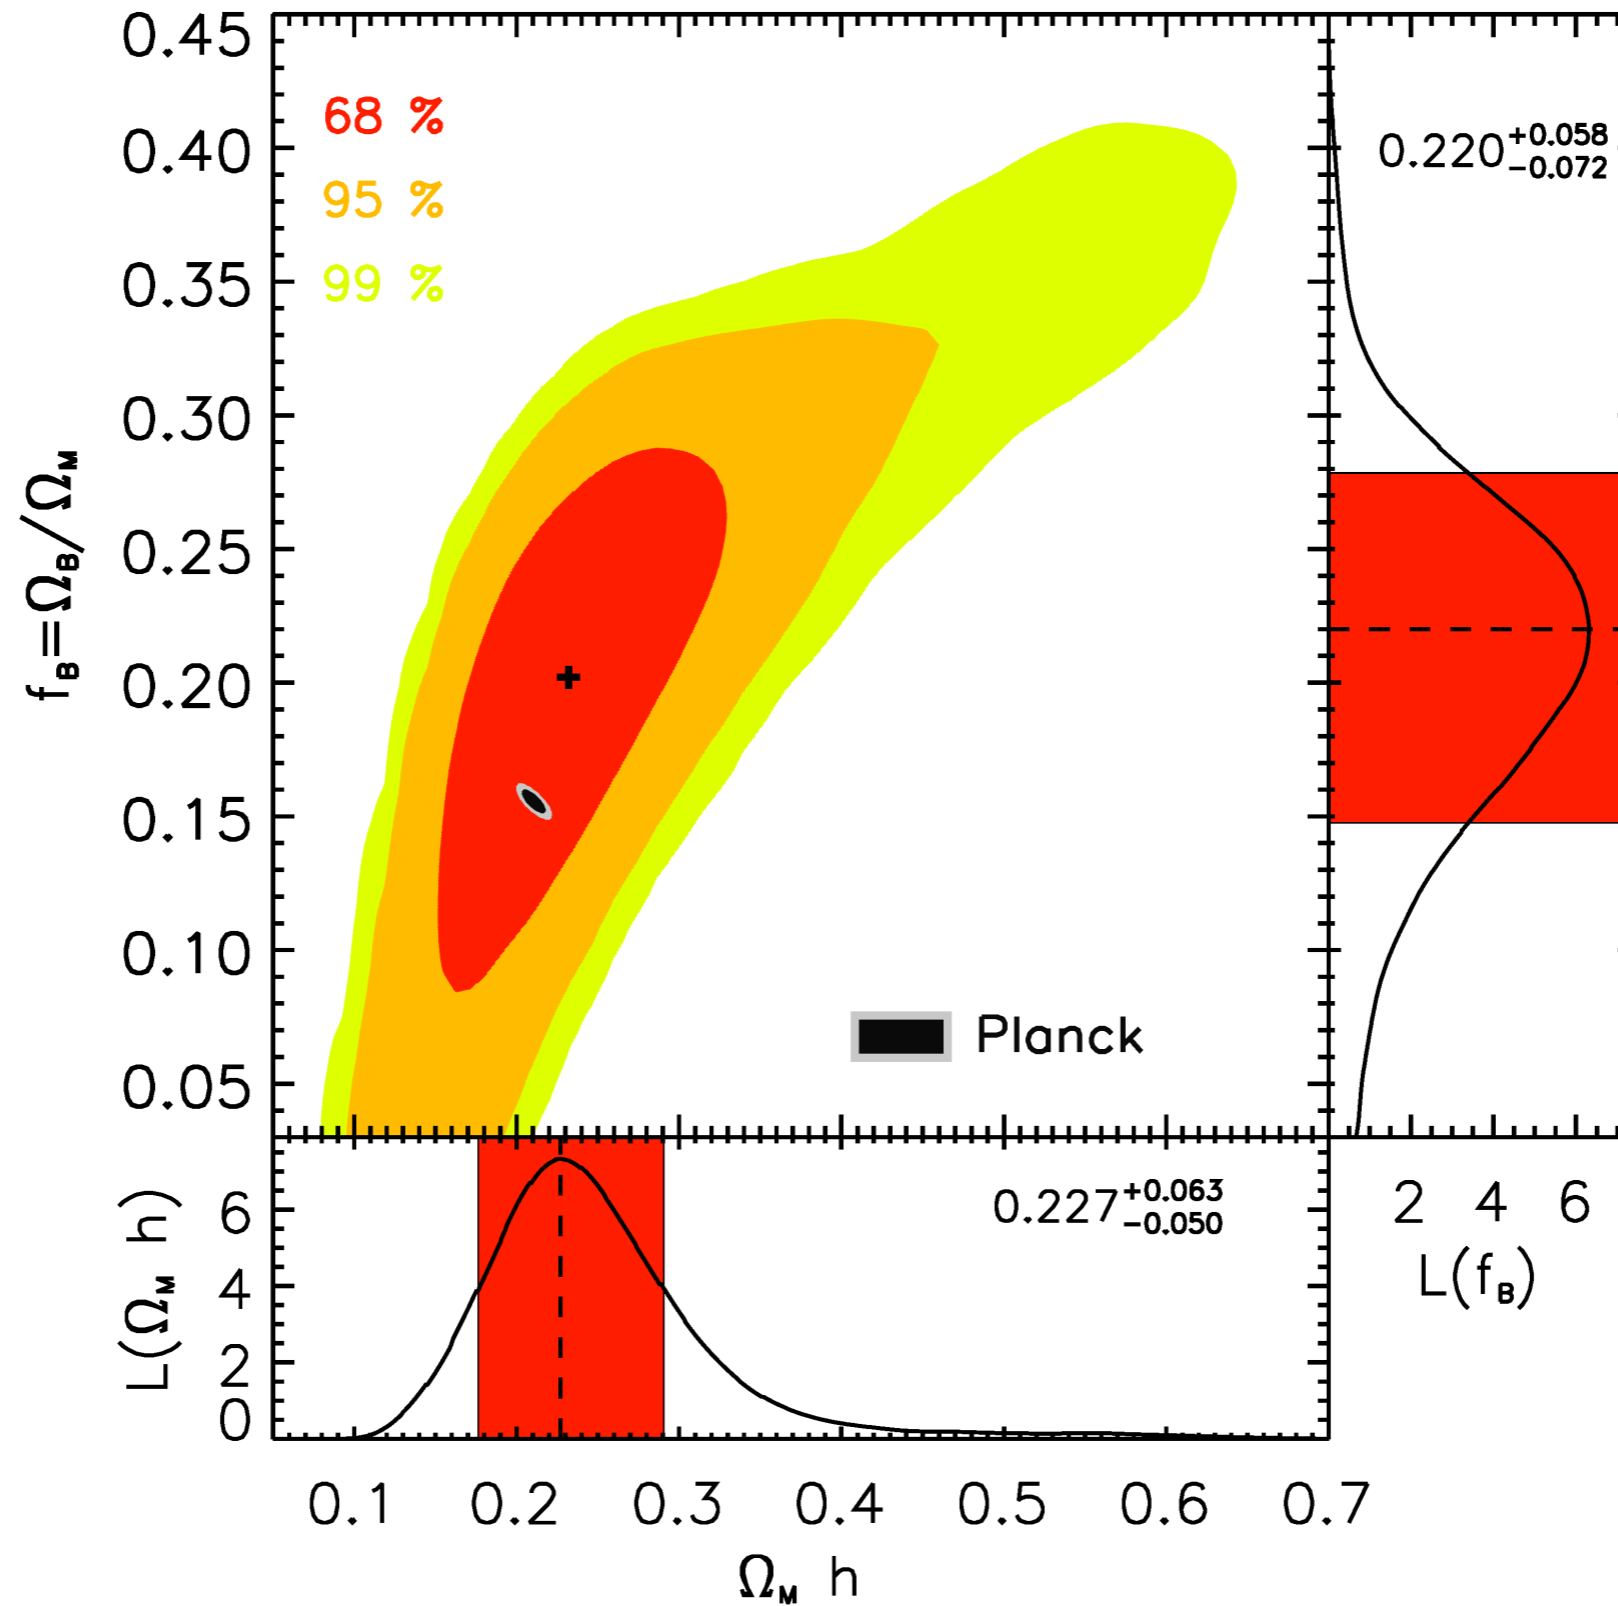

Observation VS Theory

Observation VS Theory

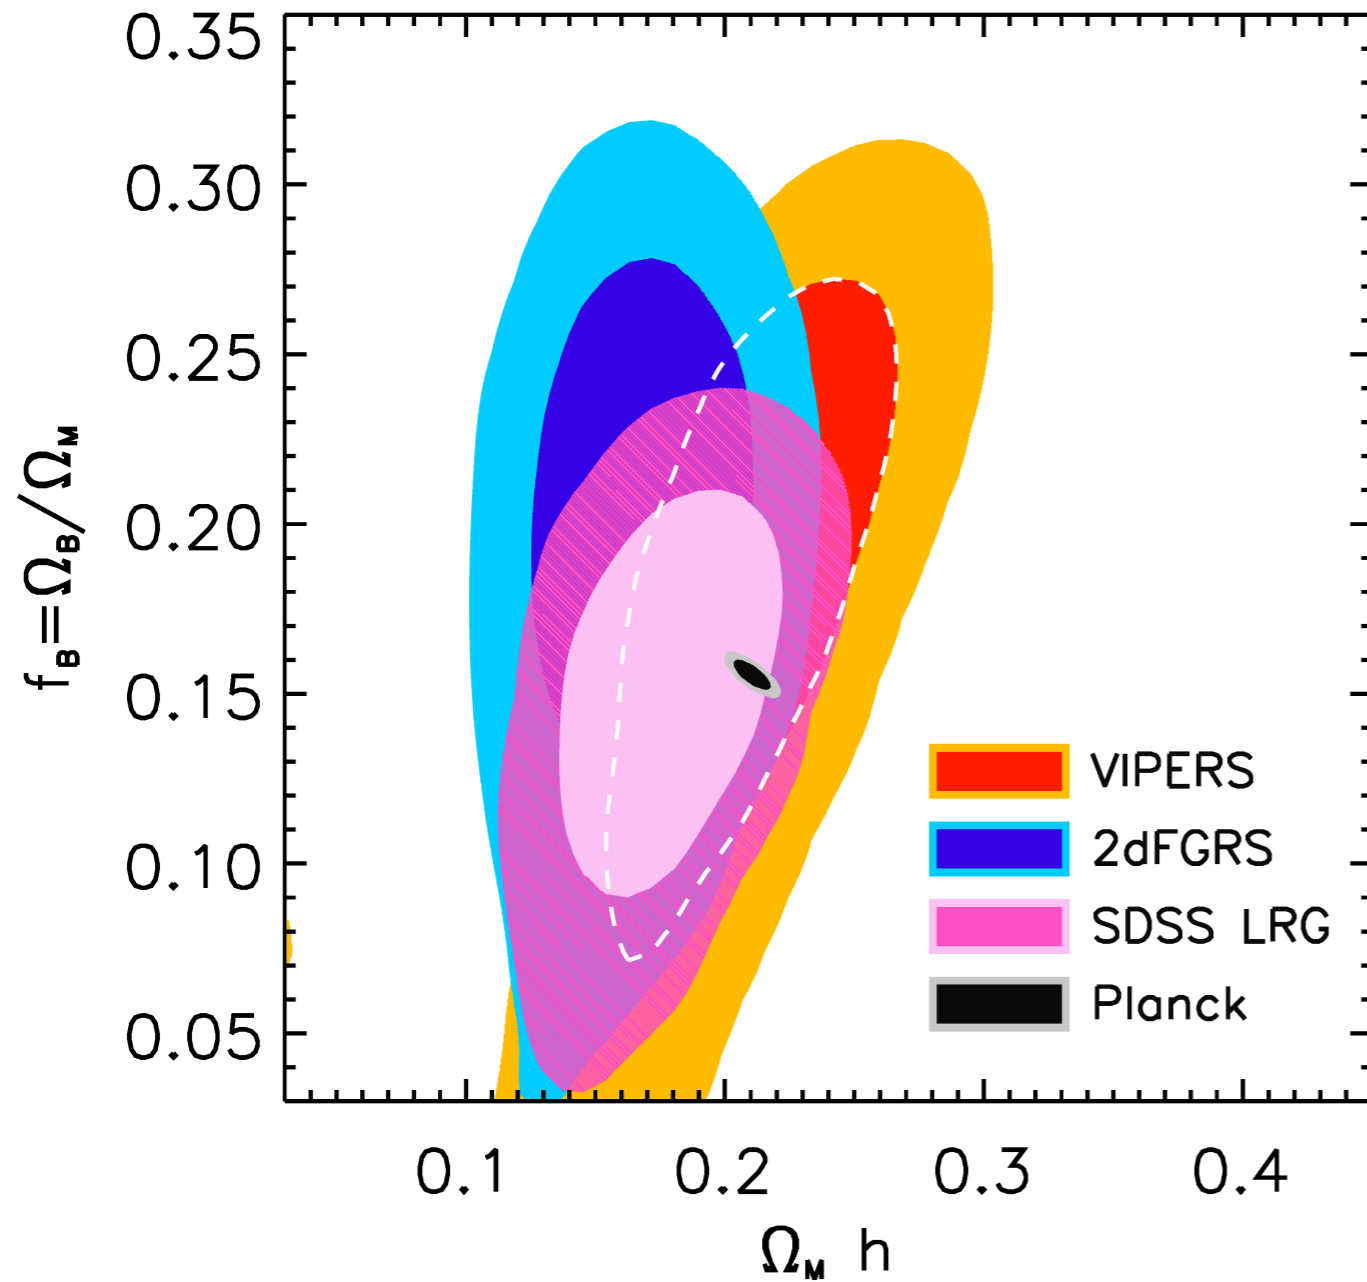

Results

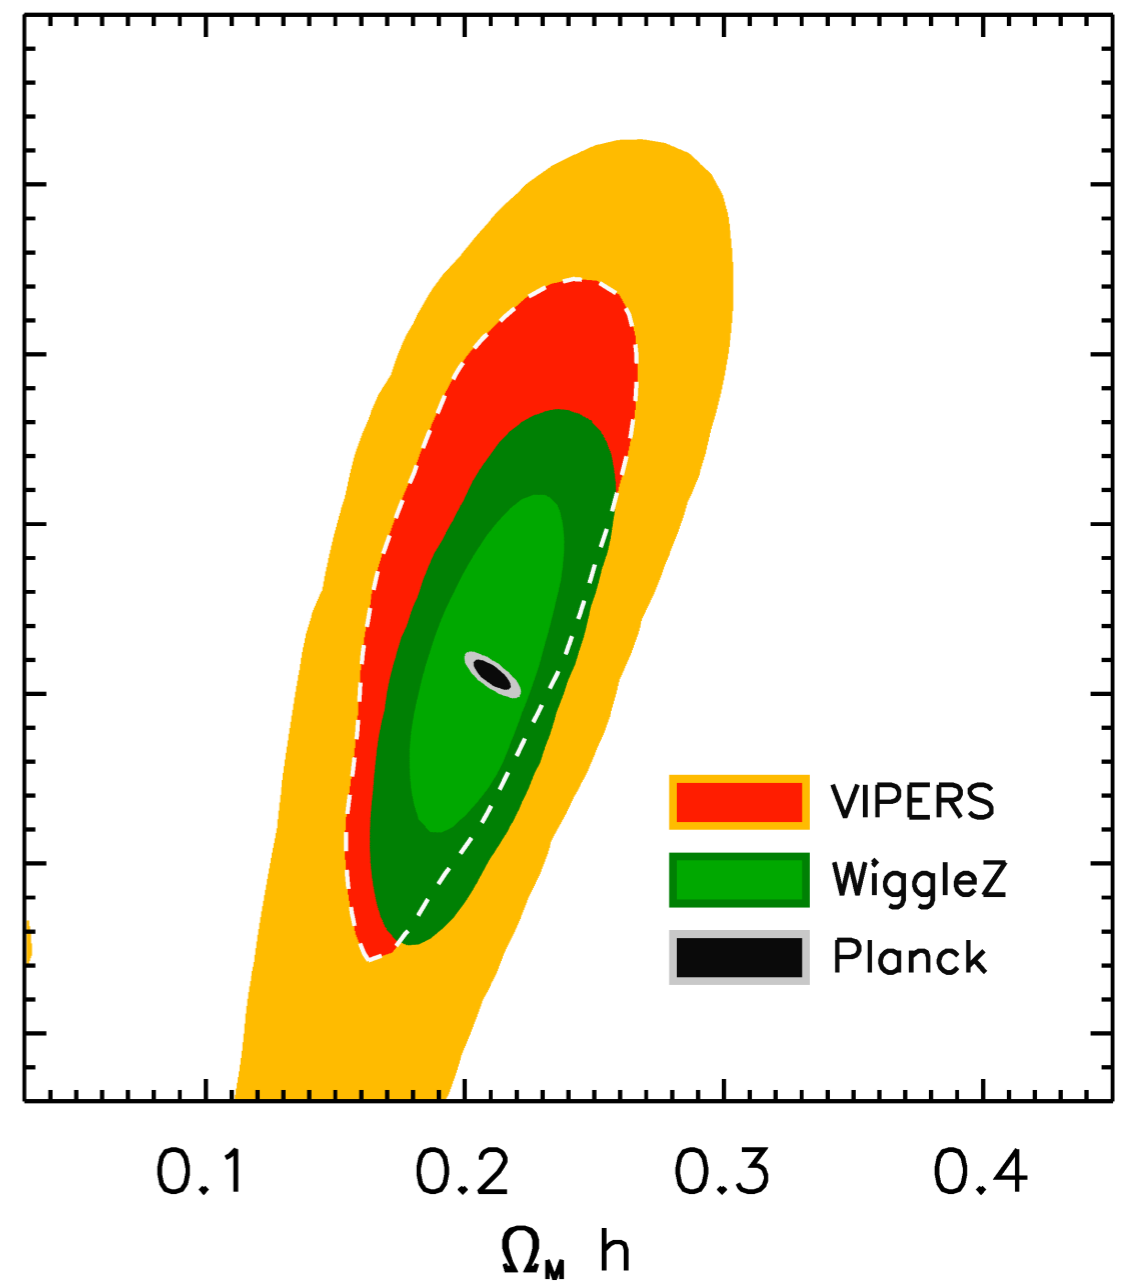

Comparison with other surveys

LOW redshift

HIGH redshift

Large Scale Structure joint likelihood
